

Connecting Mental Health, Climate Justice, and Nature Through the Project ECHO Model

Semra Aytur, PhD, MPH ^{1,2} and Corina Chao, MPH¹

¹University of New Hampshire

²New Hampshire Healthcare Workers for Climate Action

*Thank you to Jan Thomas, Kelsi West, Marcy Doyle, and Jeanne Ryer of the Institute for Health Policy and Practice at UNH. We thank Abigail Pauls, Robert C. Dewey, MD, Deborah M. Gerson, MD, Robert Feder, MD, Emily Thompson, Joan Widmer, Paula Smith, and the members of NH HWCA for their contributions to this work. We thank Denise Pouliot, Kathleen Blake, Larissa Dooley, Seoka Salstrom, David Bradley, Bob Doppelt, and Tye Thompson for their assistance with this project.

What is Climate Justice?

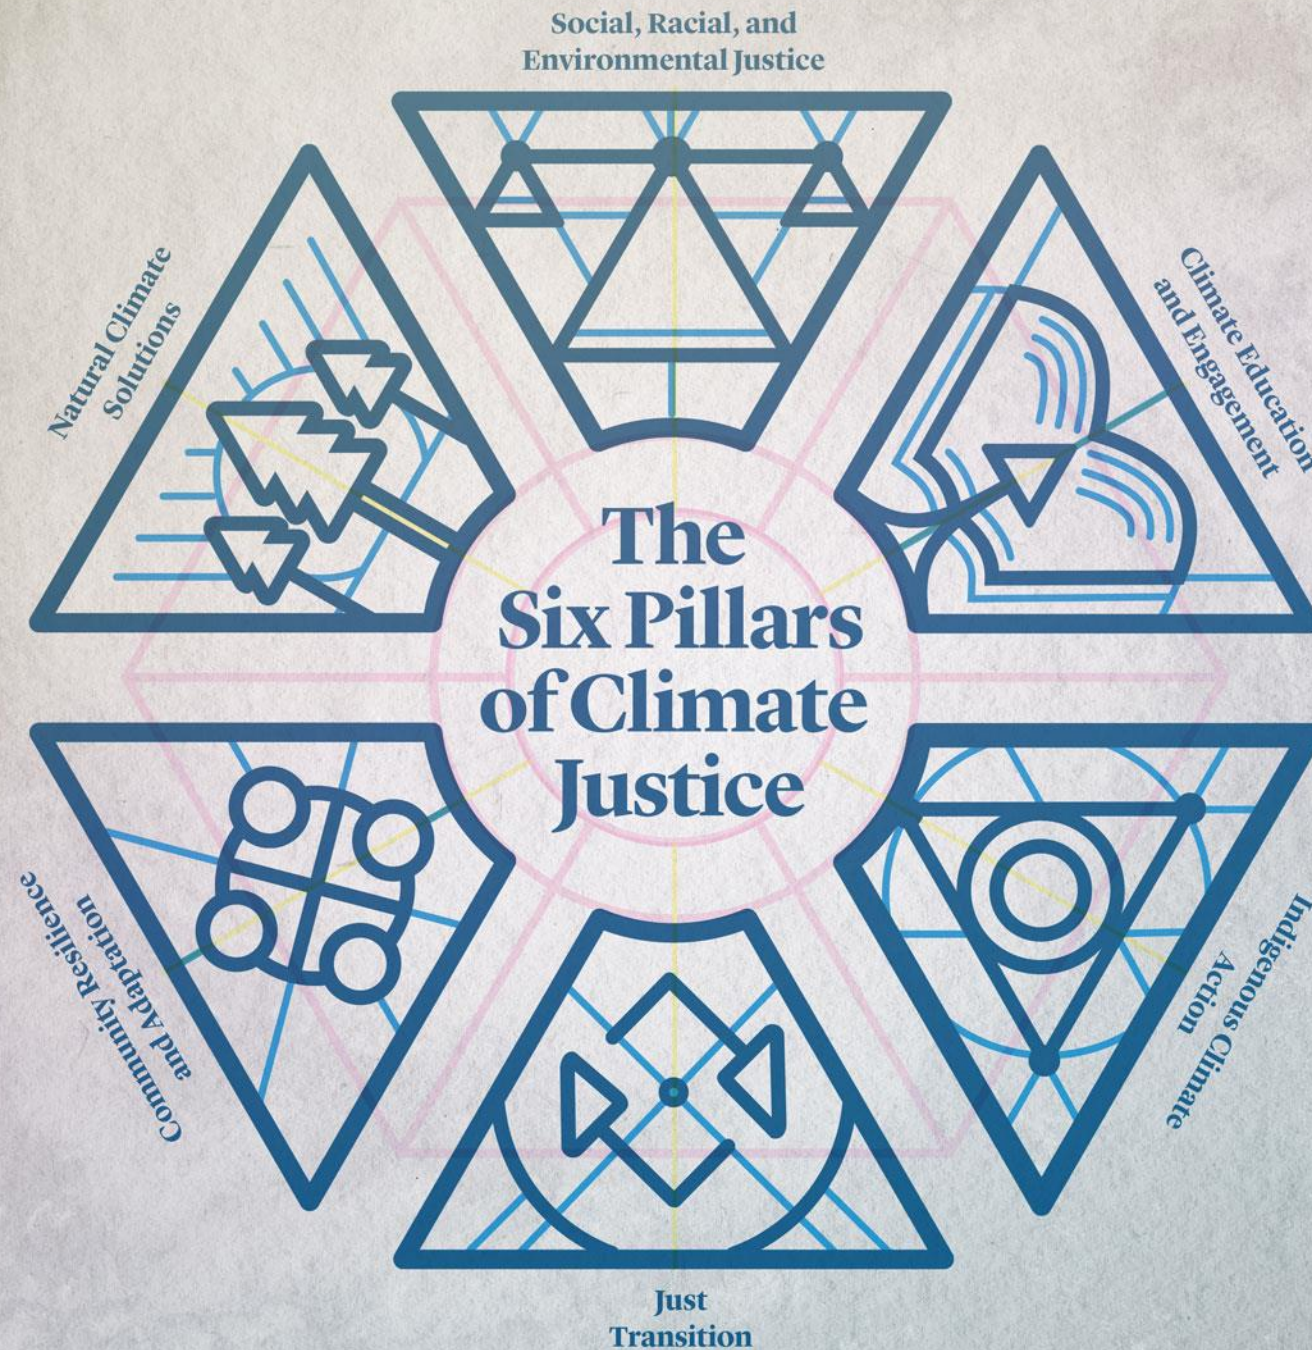

A social movement that recognizes that the impacts of climate change fall disproportionately on underprivileged and underserved communities around the world – the people least responsible for creating the problem.

Nature Disparities and Equity: The Need for Nature

Communities of color are approximately three times more likely than white communities to live in “nature deprived” areas (those that have little to no access to parks, trails, and green spaces).

75% percent of non-white families with children live in a census tract (neighborhood) with less natural land than the state average.

Access to nature and outdoor experiences are key determinants of physical, emotional and psychosocial wellbeing.

Climate Justice - Racial Disparities

- African Americans are exposed to 38% more polluted air compared to white Americans
- 13.4% of African American children have asthma compared to 7.3% of white children
 - African American children are burdened by 138,000 asthma attacks and 101,000 lost school days each year
 - Historically and structurally marginalized communities often lack access to greenspace, other health-promoting resources, and clinical care

DHHS. (2021). <https://www.hhs.gov/blog/2021/05/27/syndemics-commitment-quitting-equitably.html>

“Synergistic pandemics” or multiple epidemics that co-occur in in relation to harmful environmental and social conditions that interact to exacerbate risk
1990s Singer – SAVA syndemic (substance misuse, violence, and AIDS)

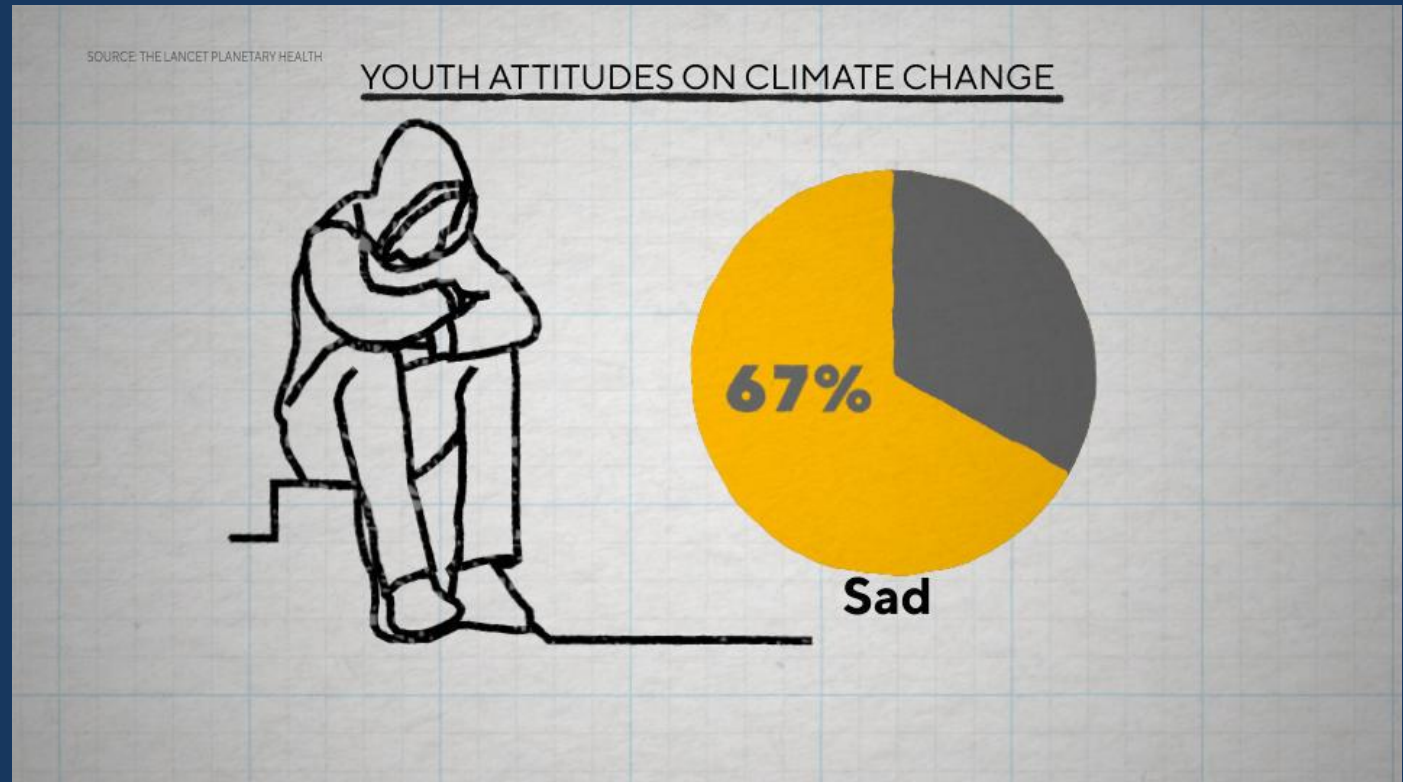

The “syndemics” lens focuses attention on the need to address multiple intersecting crises, such as COVID-19, poor mental health, climate change, structural racism, loneliness/social isolation, and ongoing chronic disease epidemics (e.g., the opioid epidemic, obesity) .

Syndemics are heightened by health inequities attributable to poverty, structural racism, violence, and stigmatization.

Addressing climate change and environmental factors may also help to prevent future syndemics, as a large proportion of emerging global disease threats are associated with climate-sensitive zoonotic diseases.

Mental Health and Climate Change

- Research suggests that 67% of youth report feelings of sadness associated with climate change (Hickman, 2021)
- 59% of youth and young adults said they were very or extremely worried about climate change and more than 45% said their feelings about climate change negatively affected their daily life and functioning.

Background: PROJECT ECHO®

- Project ECHO® (Extension for Community Healthcare Outcomes) is a tele-mentoring model originally developed at the University of New Mexico as a collaborative model of medical education and care management that helps to create a culture of health for all people no matter where they live.
- ECHO's bidirectional communication allows participants to improve knowledge, confidence, and collaborative capacity while building a supportive community of practice.
- Project ECHO® has been shown to improve health outcomes for structurally marginalized groups with limited access to care because of socioeconomic factors or geography.
- However, there is limited research on its effectiveness regarding environmental health concerns at the intersection of climate justice, mental health, and nature in community contexts.

<https://hsc.unm.edu/echo/>

Background: New Hampshire Context

- New Hampshire Healthcare Workers for Climate Action (NH HWCA), a non-profit comprised of transdisciplinary healthcare professionals in both urban and rural communities, partnered with a state University and other stakeholders to launch an innovative Project ECHO® program to educate health professionals about the connections between nature, mental health, and climate justice.
 - Project ECHO® is an innovative program designed to create knowledge networks bringing together transdisciplinary healthcare professionals, particularly in rural and underserved areas. It utilizes a tele-mentoring approach involving brief lectures and case-based presentations.
- This topic was timely in the aftermath of the COVID-19 pandemic, when many communities continue to face syndemic stressors associated with climate change, systemic racism, poor mental health, and chronic disease.
- Participants learn from both subject-matter experts and from peers.
- Indigenous perspectives were a vital component of this ECHO®.

Purpose

- To describe the development, implementation, and evaluation of a novel ECHO® designed to introduce transdisciplinary professionals to intersectional issues pertaining to climate justice, mental health, and nature
- To establish a supportive “all teach, all learn” virtual community in a region with little prior history of interdisciplinary discussion forums or social support for climate change, nature, and behavioral health issues.

The poster for Project ECHO features a scenic image of a lake and mountains. The title 'Project ECHO' is in a white oval on a green background. Below it, the text 'Connecting Mental Health, Climate Justice, & Nature ECHO' is displayed. A red button with white text says 'CLICK HERE to register!'. The poster is divided into sections: 'Audience:' lists Mental Health Professionals, Public Health Professionals, Healthcare Providers, Emergency Responders, Community Health Workers, Disaster Response Teams, Environmental Scientists, and Students, Trainees. 'Session Dates:' are November 2nd, 16th, 30th and December 14th. 'Time:' is 12:00 - 1:00pm. 'Be Able To:' lists describing climate change impacts, exploring collaborative strategies, discussing climate justice, and explaining the role of nature. A green box for 'Questions?' provides contact for Corina Chao. A green box mentions 'Continuing Education Credits'. A green circle says 'Click here to learn more about Project ECHO'. Logos for the Institute for Health Policy and Practice, NH Citizens Health Initiative, and AH EC are at the bottom.

Project ECHO
Connecting Mental Health, Climate Justice, & Nature ECHO

[CLICK HERE to register!](#)

Audience:

- Mental Health Professionals
- Public Health Professionals
- Healthcare Providers
- Emergency Responders
- Community Health Workers
- Disaster Response Teams
- Environmental Scientists
- Students, Trainees

Session Dates:
November 2nd, 16th, 30th
December 14th

Time:
12:00 - 1:00pm

Be Able To:

- Describe climate change impacts on mental health
- Explore collaborative strategies for promoting resilience
- Discuss climate justice
- Explain the role of nature in health and healing

Questions?

NH CITIZENS HEALTH INITIATIVE
AH EC

Methods

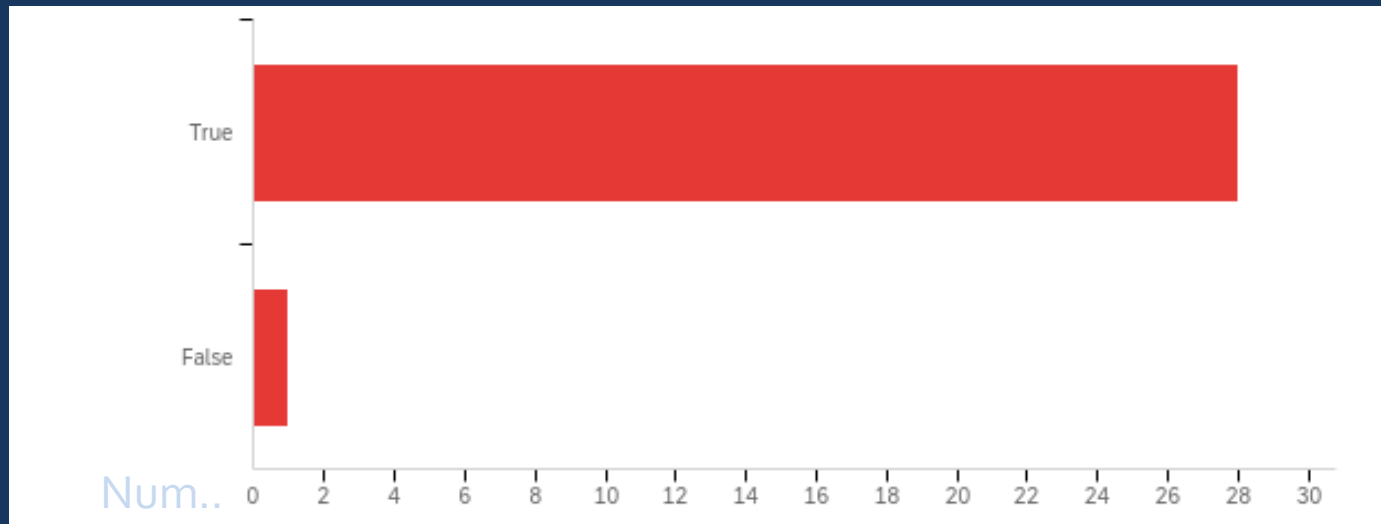

- The ECHO ® was conducted over a 6 week period during the fall of 2022
- 4 modules
- Web-based surveys were sent to all participants before and after the ECHO.
 - Questions pertained to changes in *knowledge, confidence, and collaborative capacity*
- Over 100 responses were analyzed using descriptive statistics and thematic analysis.

RESULTS

- Before participating in the ECHO, approximately half of respondents stated that they had received no prior training or information about the mental health impacts of climate change.
- After participating in the ECHO, the majority of respondents reported that the ECHO helped to better prepare them to describe the impacts of climate change on mental health and well-being.

RESULTS

“My level of knowledge about the relationships between climate change, mental health, equity, and nature increased after participating in this ECHO®.”

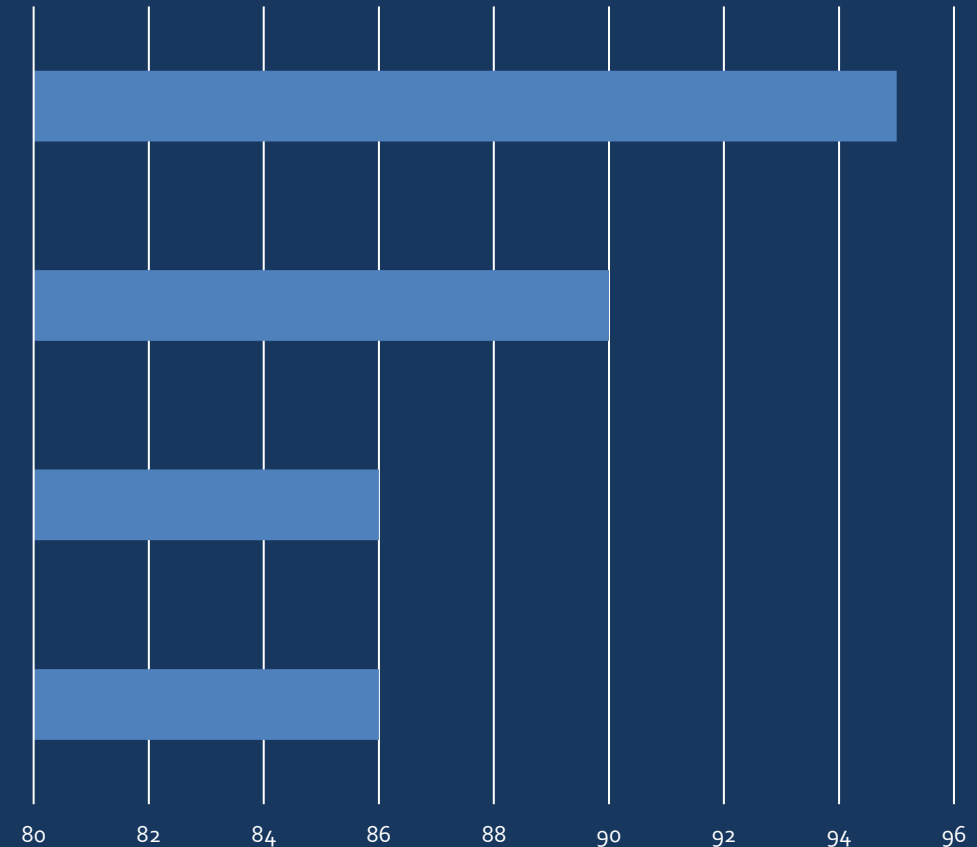

~95% of respondents reported that the teaching strategies and resources were effective, and that the ECHO enabled them to explain how pre-existing stressors create high risk for mental health impacts.

RESULTS

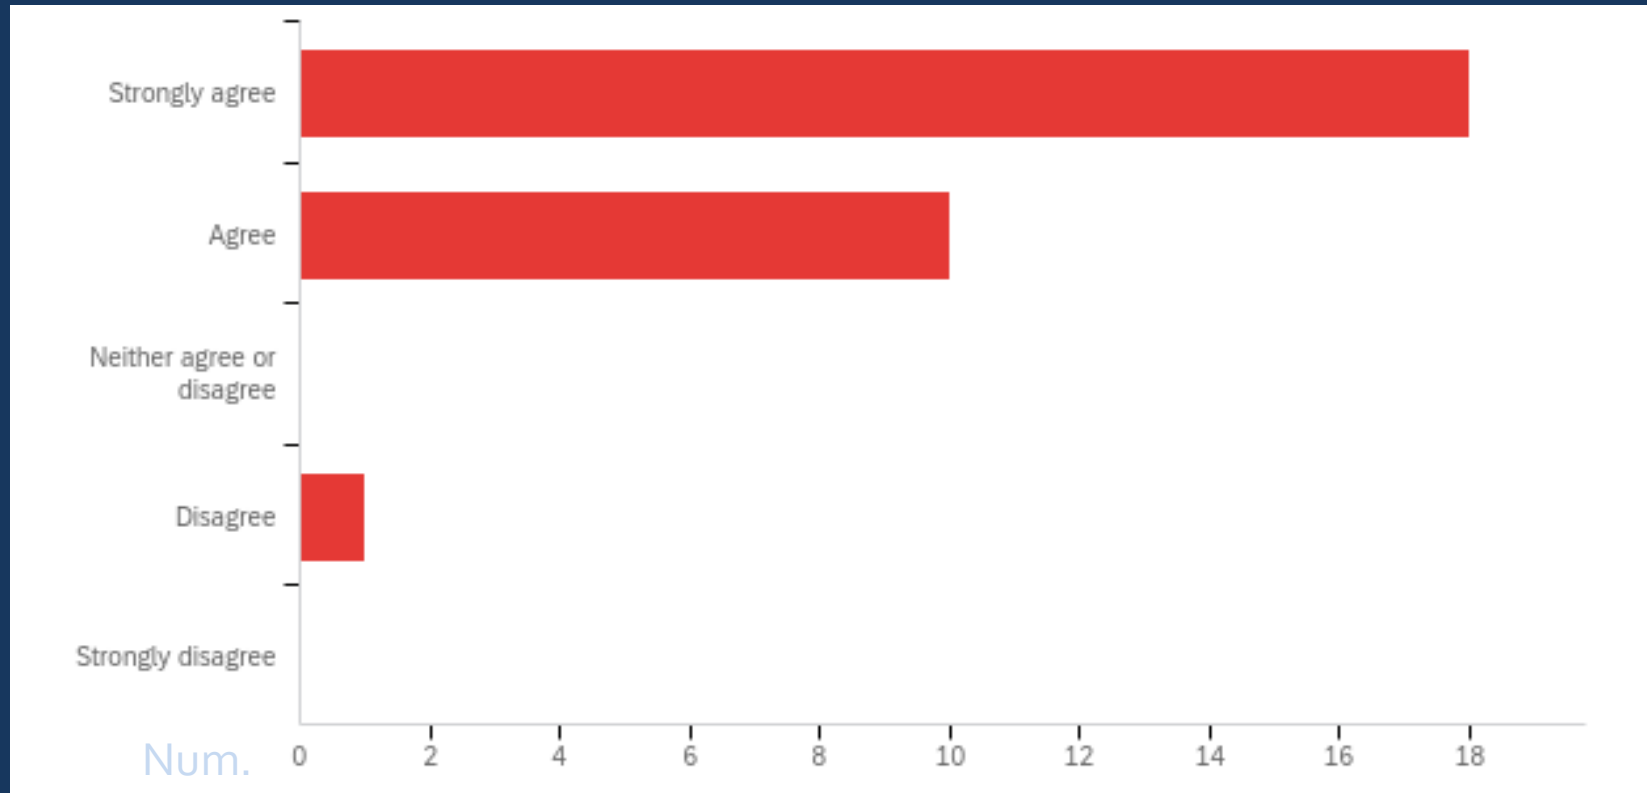

Confidence in specific domains (Post ECHO) %

- Confidence in your ability to collaborate with others who are concerned about climate change and human health
- Confidence in your ability to include individuals with different perspectives, identities, and disciplinary affiliations in conversations...
- Confidence in your ability to communicate with others on issues related to mental health, climate change, and equity
- Confidence in your ability to describe climate justice

RESULTS

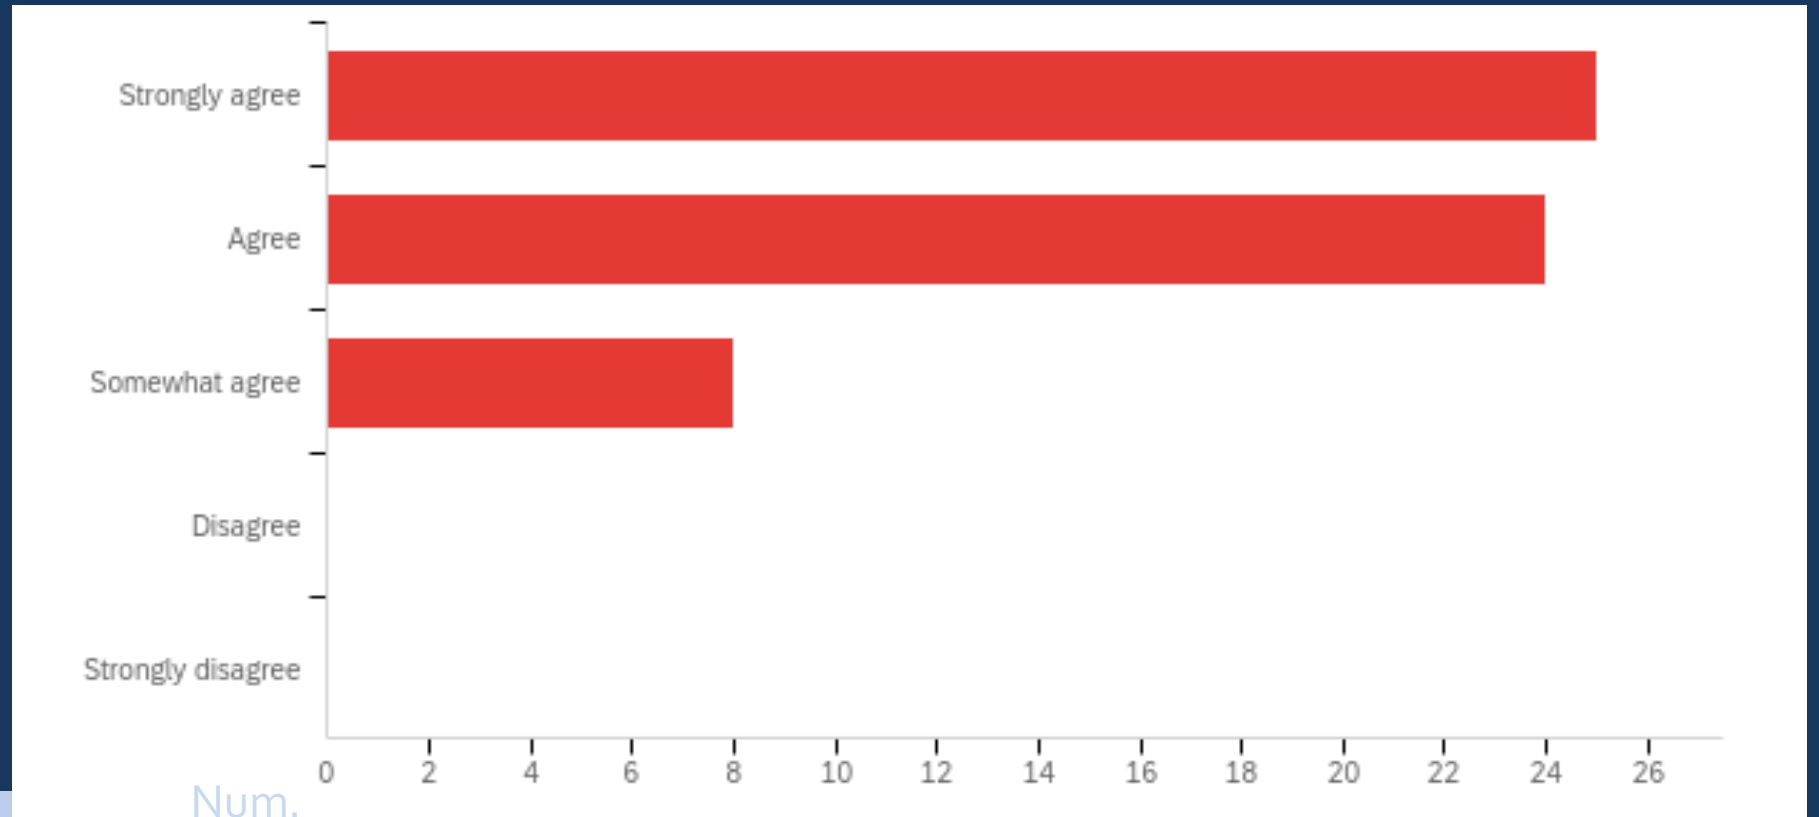

The ECHO® improved my confidence in my ability to communicate with others about relationships between climate change, mental health, equity, and nature.

RESULTS

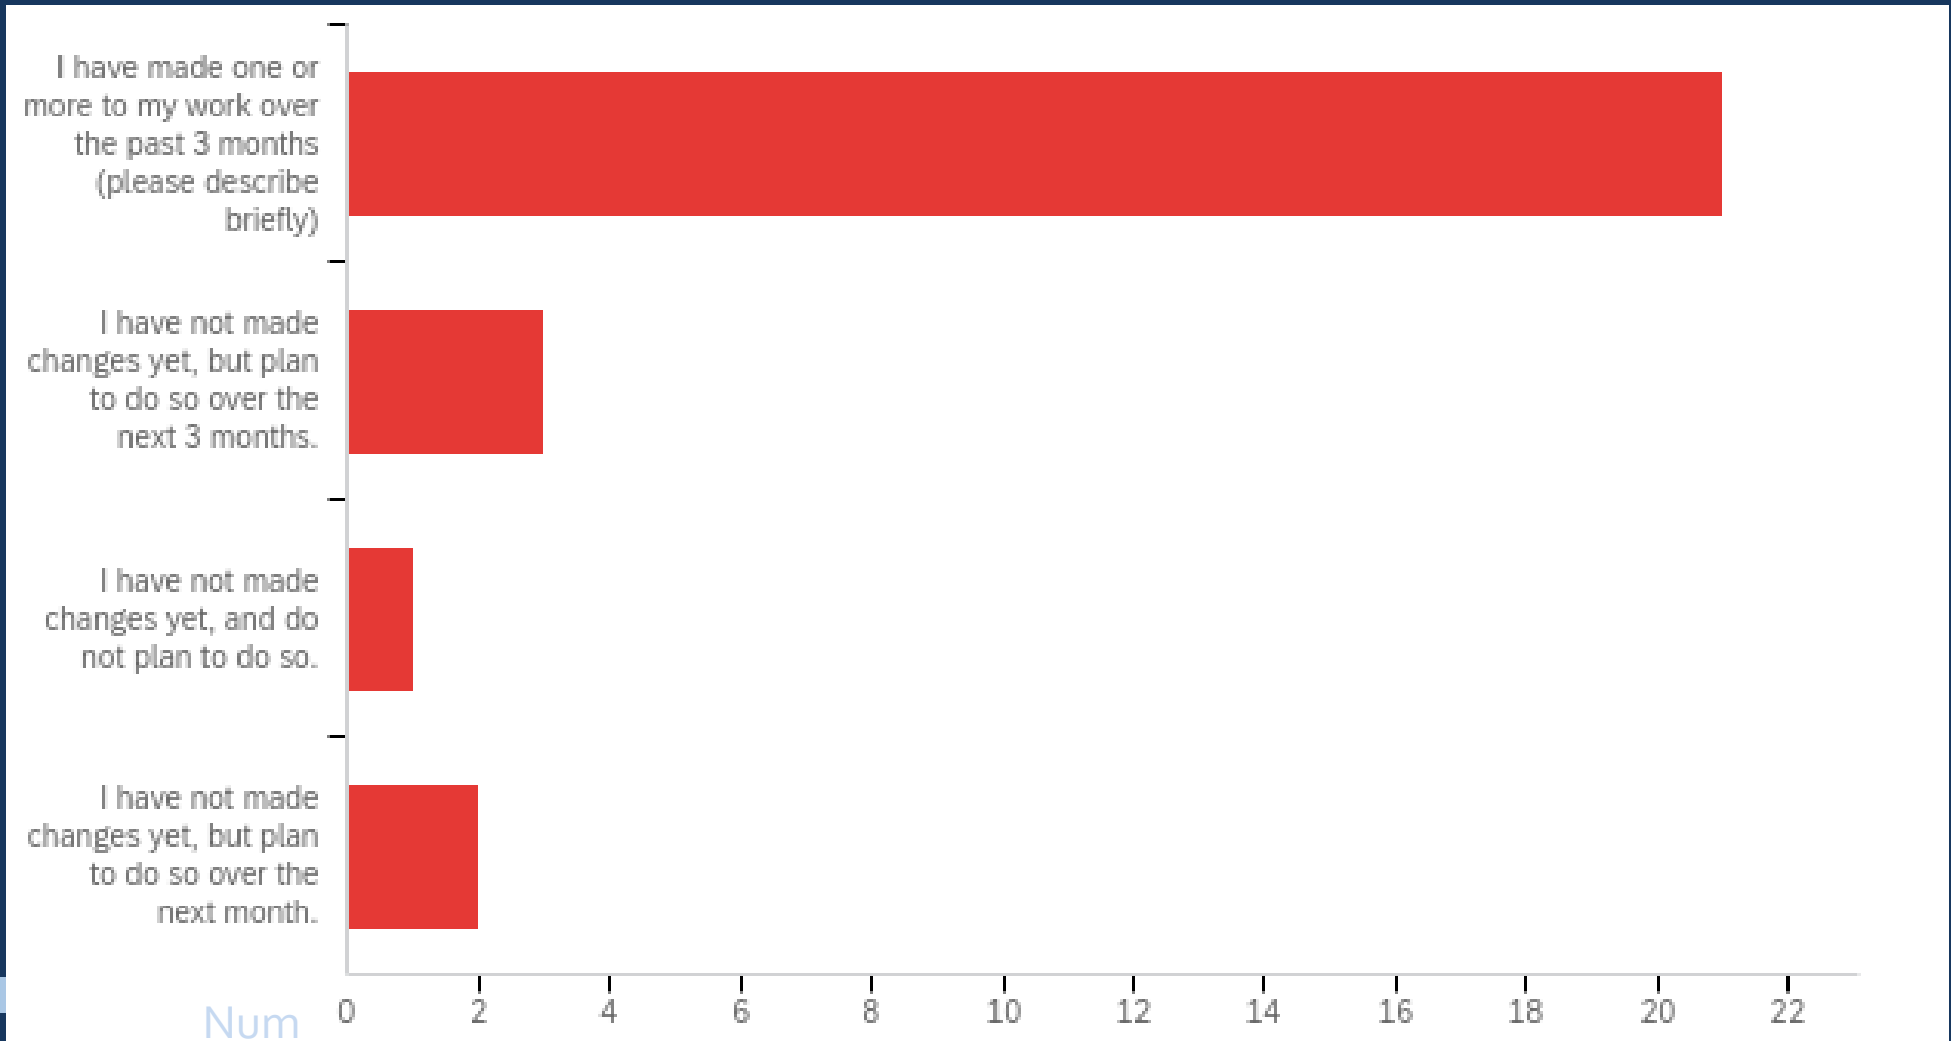

Collaborative Confidence:

This ECHO® increased my level of confidence in seeking out new potential partners/collaborators and opportunities pertaining to conversations about climate change, mental health, and equity.

RESULTS

Have you made any changes in your work over the past 3 months related to the ECHO® sessions?

Survey questions were based on the transtheoretical model of behavior change (TTM). (Prochaska et al. 1997, PMID: 10170434.)

QUOTES

I am integrating nature-based approaches into my workplace wellness initiatives, and I'm beginning to teach environmental health/climate change content in public health courses for college students.

I wrote a grant with public health professionals to increase access to nature-based therapy and mindfulness.

I collaborated with a public health professional to bring "Blue Space" interventions (interventions centered on water resources) into research, teaching, and citizen science initiatives. I also worked on Blue Space initiatives with international collaborators.

I co-led three large grant proposals on nature-based solutions (NbS) to public health challenges. I also sustained meaningful relationships with people I met through the ECHO®. Examples of work resulting from these collaborations includes a presentation on "Climate Change and Mental Health" to over 85 staff members through a workplace wellness program, and a planned follow-up webinar series on transformational resilience with two of the other ECHO® Subject Matter Experts

Started a new collaboration formed between Practice-Based Research Networks (PBRN) and NH-HWCA, new research interest group around climate health in rural New England primary care practices, new potential research idea in climate mindfulness.

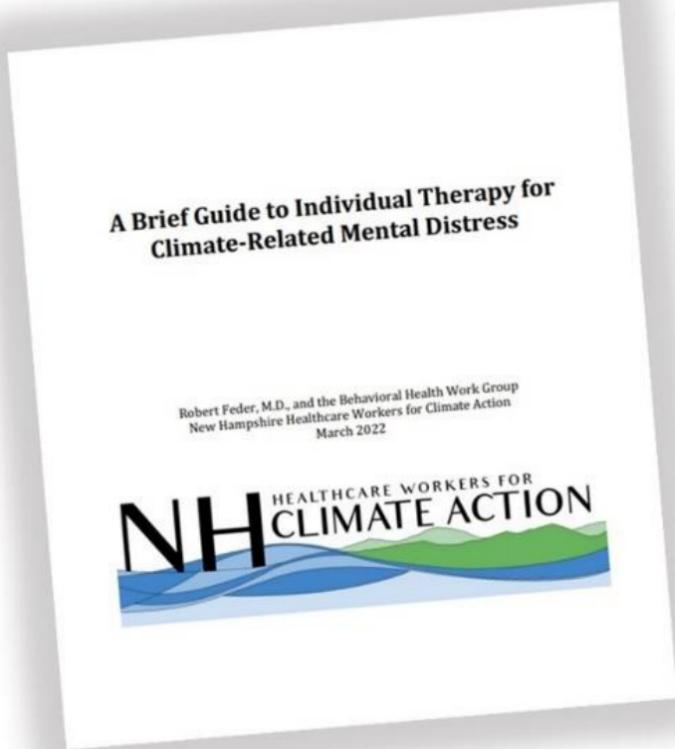

Asked about climate anxiety in therapy sessions.

My colleague and I have talked about integrating climate change wellness components into outreach and engagement programs. I've brainstormed wellness activities and coping mechanisms to teach students during climate change education programs.

Conclusions

- Participants discussed ways to improve learning regarding a variety of topics, including equitable nature-based solutions, Indigenous perspectives, blue space, and forest-based interventions.
- Participants reported having increased knowledge, confidence, and collaborative capacity regarding the connections between mental health, climate justice, and nature.
- Project ECHO® can be an effective model for building communities of practice for transdisciplinary stakeholders in planetary health initiatives.
